Safety in Design

December 2018

Health and Safety

Intent

Safety in Design considers how to eliminate or minimise hazards and risks to those who will construct, operate, maintain, modify, decommission or demolish an asset.

DNZ has a procedure in place to ensure that Safety in Design begins in the conceptual and planning phases of all projects. This procedure ensures we make the right choices about the design as early as possible to enhance the safety of the project. These choices may include appropriate methods of construction, on-going maintenance provisions, or materials used.

Performance Requirements

1.1 DNZ's Safety in Design Procedure will be used for all projects
